SUMMARY OF RESEARCH PROGRAM:

Our laboratory develops and tests metabolic-based therapies and drugs that target pathways linked pathophysiologically to seizure disorders, neurodegenerative diseases, glycemic dysregulation, cancer cachexia and skeletal muscle wasting. To investigate the mechanism of these pathologies we use a variety of in vivo and in vitro techniques, including radio-telemetry (EEG, EMG), electrophysiology, fluorescence microscopy, confocal microscopy, atomic force microscopy (AFM), electron microscopy, histology, biochemical assays, metabolomics, toxicology, in vivo bioluminescence imaging, spectrophotometry, behavioral testing and motor function testing. Our work has adapted and utilized radio-telemetry, confocal microscopy and AFM for use inside hyperbaric/hypobaric chambers to simulate environmental extremes. These tools allow us to conduct environmental physiology, and tissue and cellular studies under a broad range of oxygen concentrations and gas pressures. Our past and current projects, supported by the Department of Defense (DoD) and Office of Naval Research (ONR), have identified cellular and molecular correlates of CNS oxygen toxicity (CNS-OT) seizures. Our efforts have focused specifically on measuring neuronal excitability, reactive oxygen species (ROS) production, biomarkers of oxidative stress and global blood and tissue metabolomics. Our in vitro and in vivo studies continue to explore the efficacy, mechanism of action and safety of metabolic therapeutics with current efforts focused on moving metabolic-based therapies into human clinical trials.

Title: Assessment of Glycerol Tris *D,L*-3-Hyrdoxybutyrate in GLUT1D Syndrome
Purpose: The ketogenic diet is used for the metabolic management of GLUT1D, and manages the disease symptoms even in the presence of a persistent molecular pathology (*e.g.* SLC2A1 defect). This study used a novel tri-ester of the ketone beta-hydroxybutyrate (BHB) in a GLU1D mouse model to induce therapeutic ketosis to preserve brain energy metabolism during hypoglycorrhachia.

Title: Cellular Mechanisms of CNS Oxygen Toxicity
Purpose: The primary objective of this project was to determine if a predictable pattern of cardiopulmonary changes precede onset of CNS oxygen toxicity, which could potentially be used as a biomarker of an impending O_2-induced seizure. The second major goal is to determine the neuroprotective effects of hyperoxic preconditioning against CNS O2 toxicity.
